

JEFFREY PALMER

Full-Stack Software Engineer | Application Architect

Dallas, TX • hire@jeffpalm.dev • 214-907-6302

jeffpalm.dev • linkedin.com/in/jeffpalmdev • github.com/jeffpalm

PROFESSIONAL SUMMARY

Full-stack engineer with 10+ years building production web applications and the patterns that scale them. Currently the **lead developer** on a Tier 1 enterprise document-management platform at NextEra Energy — owning frontend, API, event-processing, and AWS infrastructure end-to-end. Track record of replacing manual processes with software that delivers measurable business impact (driversselect: 30% labor reduction, ~\$7.5MM/yr in savings). Daily user of AI-assisted development (Claude, Windsurf, Copilot, etc.) as a primary delivery method, not a side experiment. Pragmatic about right-sizing — comfortable knowing when a small internal tool needs to ship fast and when a Tier 1 system needs hardened patterns, security review, and reusable templates the rest of the team can build on.

CORE COMPETENCIES

Architecture & Design: Application architecture for small-to-mid-size web apps, data modeling, REST/GraphQL API design, authentication/authorization flows, integration patterns, component reuse, technical standards & reusable templates

AI-Assisted Development: Claude + Windsurf (daily), Copilot, AI-driven code generation, review, and refactoring as a primary delivery workflow; designing patterns and structures that AI tooling can extend reliably

Frontend: React 19, React Router v7, TypeScript, Blazor, Angular, TailwindCSS, TanStack Query, Storybook component libraries, Radix UI

Backend: NestJS, Node.js 22, .NET (Core & Framework), Python 3.12, AWS Lambda (serverless), Express, Prisma, Dapper

Cloud & Infra: AWS (Lambda, DynamoDB, S3, Cognito, MSK/Kafka, API Gateway, VPC, IAM, Secrets Manager, SSM), AWS CDK (TypeScript), CloudFormation, Docker, Kubernetes

Security & Auth: AWS Cognito SSO, JWT, role-based access control, MSK IAM SASL, secrets management, audit logging, CodeQL/SonarQube remediation, least-privilege IAM

Data: DynamoDB schema design, PostgreSQL, SQL Server (T-SQL, stored procedures, .sqlproj), MySQL

DevOps & CI/CD: GitHub Actions, Bitbucket Pipelines, multi-env deploys (dev/sit/uat/prod), Husky, Prettier, SonarQube, CodeQL

PROFESSIONAL EXPERIENCE

Senior Software Engineer — IBM (Dialexa, an IBM Company) Jun 2022 – Present | Dallas, TX

Consulting engineer placed on Tier 1 enterprise builds. Across three engagements, served as primary builder and architect on small-to-mid-size full-stack systems — defining data models, auth flows, API contracts, and reusable patterns the rest of each team followed.

NextEra Energy — Lead Full-Stack Developer, NOVA & ETRM Integration Sep 2025 – May 2026

NOVA: enterprise document-management platform attaching external documents to Openlink ETRM objects (Invoices, Confirmations, Deals, Party Agreements). ETRM Integration Middleware: Kafka/Lambda/CDK platform connecting Openlink, iLibri/Documentum, ServiceNow, and downstream systems.

- **Primary builder on a Tier 1 system:** authored 76% of webapp commits (93/122) plus the bulk of NestJS API and Python event-processor work; defined the architecture across React frontend, Lambda-hosted API, and Kafka event consumer.
- **Designed authentication & authorization end-to-end:** AWS Cognito SSO with Amplify, JWT decoding/SLID extraction, security-group-based authorization middleware backed by a DynamoDB permissions table, stale-session handling, and SSO entry-path redirect.

- **Owned data modeling & API design:** DynamoDB schema for Invoices/Confirmations/Transactions/Party Agreements; led a 1.1.0 release migrating permission fields to a NamedRef[] schema, re-keying tables, and aligning seed pipelines and contract tests across 4 environments. Designed REST APIs (NestJS 11) with Swagger/OpenAPI documentation.
- **Built reusable patterns the team builds against:** EntityTable / EntityBrowser / EntityFilters component library, custom hooks (useNovaPaginatedQuery, useNovaSearchAndFilter, useNovaDropzone), centralized api.ts HTTP module replacing axios with native fetch, and 11+ GitHub Actions workflows (build/test, deploy, SonarQube/CodeQL, DB seed, Kafka tooling).
- **Hardened security & operations:** MSK IAM SASL authentication for Kafka producers, presigned-URL S3 uploads (no secrets in client), CodeQL fixes for clear-text logging and log injection, AWS Secrets Manager + SSM for credentials, VPC-aware Lambda subnet selection fix that eliminated AZ-pair drift across deploys.
- **Reusable infrastructure tooling:** refactored inline CloudFormation S3 deploys into a single deploy-s3.sh + reusable workflow; built an orphan-legacy-S3 pipeline with Retain policies enabling safe migration of legacy CFT-managed buckets to CDK without data loss.
- **Quality focus:** adopted pytest + pytest-cov on the event-processor Lambda and raised coverage to 99%, including a contract test pinning the cross-system NamedRef[] payload shape.

Tax Advisors Group — Senior Software Developer, Project Ava Jul 2024 – May 2025

Next-generation .NET + Blazor platform expanding TAG's property tax business beyond Texas.

- **Shipped Freeport Tax Exemption end-to-end** (eligibility logic, jurisdiction-aware form generation, supervisor approval workflow, external tax-office mailer integration). Feature is responsible for ~30% of all TAG revenue.
- **Built a live debugging tool** for the test environment that substantially improved the QA team's manual testing speed and accuracy — example of internal tooling targeted at non-engineers (analogous to building patterns business contributors can use).
- **Implemented Blazor StyledButton design-system component** with CSS variables and full variant support, extracted from a Figma component spec — exactly the reusable-pattern model WTG needs scaled to a portfolio.

Deloitte — Senior Software Developer, AboutMe Jun 2022 – Jun 2024

Global tax application serving Deloitte Professionals across 53 countries and 6 languages (.NET back-end + Angular front-end).

- **Led cloud modernization** transitioning the backend from .NET Framework to .NET Core, including data-access refactor from inline SQL to stored procedures via Dapper and a .sqlproj project.
- **Built automation scripts** that saved the client substantial manual hours; implemented a dependency-graph-driven pub-sub pattern for conditional question logic on the front end.

Software Engineer — TrackNow, Inc. (DBA Covr) Dec 2020 – Jun 2022 | Remote

Workforce management platform for long-term, post-acute care facilities.

- **Led incremental modernization** of a legacy PHP monolith into cloud microservices using the strangler pattern.
- **Set team-wide standards:** replaced manual deployments with an automated Bitbucket Pipelines CI/CD pipeline; introduced a Storybook reusable-component library that improved design-team handoff and drove consistent UI patterns across the codebase.
- **Owned 2 major features end-to-end** that drove ~250 new facility signups (50% growth in client base): a Meal Break Tool (questionnaire distribution via mass SMS to hourly employees, raffle feature) and a Message Center (mass SMS/MMS on Twilio, custom real-time delivery status via WebSockets). Stack: React/TypeScript + NestJS + Prisma/Postgres + AWS/Kubernetes.
- **Founded the team's weekly knowledge-share meet-ups** (Docker, TypeScript, AWS, design patterns) — a precedent for the kind of enablement WTG wants in this role.

Business Process & Systems Manager — Sonic Automotive / EchoPark Sep 2015 – Mar 2020 | Dallas, TX

(Previously branded driversselect)

Hands-on internal application builder before transitioning to consulting. The closest analog in my background to WTG's portfolio model: a single technologist building internal applications that replaced manual processes across a multi-department business.

- **Built and maintained the employee portal website** — the central internal application replacing manual workflows across Sales, Finance, Procurement, and Reconditioning.
- **Created technology-driven operating efficiencies that reduced ~30% of labor time**, saving the business approximately \$7.5MM annually (~\$30MM over 4 years).
- **Increased per-salesperson sales efficiency ~30%**, contributing to an increase from 400 to 1,500 cars sold monthly in a single location.
- **Reduced average funding time from 5 days to 2 days** via workflow automation; led the post-acquisition CRM and internal-systems transition for Sonic Automotive.
- **Generated and maintained metric reporting** for Sales, Finance, Procurement, and Reconditioning departments.

EDUCATION

Full-Stack Web Development Certificate, with Honors Jul 2020

DevMountain (Strayer University)

ADDITIONAL

- Eagle Scout
